I. T. CONSULTING INC.
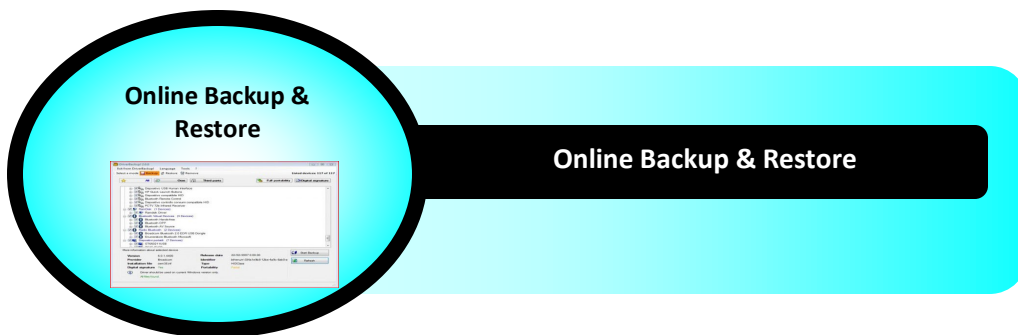

Automatically backup data from desktops & laptops to an off site top-tier data-center providing an accurate, secure & worry-free data store.

Online Backup & Restore

Online Backup & Restore

Online Backup & Restore is a fully automated online backup solution for desktops & laptops delivered as a minimal maintenance, SaaS solution. The service helps eliminate the uncertainty of traditional data backup methods through an automated process requiring access to the corporate network or VPN.

It is deployed with a simple Internet connection, enabling IT administration to set backup policies that run automatically in the background whenever the user connects to the Internet—no end-user action required.

The service is controlled with a centralized IT management & reporting console, allowing desktops & laptops behind on backups to be easily identified by user or machine name. Delayed or missing backups can be jump-started from the management console. Automated scheduling allows backups to be executed during office down time.

IT resources are reduced as implementation does not require a dedicated staff, reducing time spent on deployment & daily management.

Key Benefits

- Effectively eliminate data loss & user dependency

- Centrally manage all Backups

- Easily deploy with minimal network impact

- Intuitive, easy to configure & use dynamic interface

- Minimal network impact

- Designed for distributed environments
